Introduction

The R&S®SFE is a multistandard-compatible broadcast signal generator which supports all common TV standards and a number of audio broadcasting standards. Whether analog or digital terrestrial TV, cable, satellite or mobile TV, or digital audio broadcasting – all these signals can be generated in realtime. For this purpose, the R&S®SFE combines a high-performance RF modulator, a universal realtime coder, and a baseband signal source in a single instrument.

Owing to its modular concept, the R&S®SFE can be optimally adapted to the specific conditions – e.g. with an integrated noise generator or a BER tester. By installing software options, the R&S®SFE can quickly and easily be expanded at a later time to include new modulation modes (max. 3). This can be done on-site and without having to open the instrument.

The versatile baseband signal source for digital TV standards allows the generation of test signals from Rohde & Schwarz libraries and the replay of customer-specific transport streams. For analog TV, the R&S®SFE offers an integrated video/audio test signal generator. Alternatively, both transport streams and analog A/V signals can be fed in by external baseband generators. Irrespective of the realtime coders used, an ARB waveform generator can be used to generate any modulation signal needed and to replay waveform files of the customer.

The R&S®SFE is compact and space-saving in design. It offers the same convenient graphical user interface as the high-end R&S®SFU as well as comprehensive remote-control options.
